BEST AVAILABLE IMAGES

Defective images within this document are accurate representations of the original documents submitted by the applicant.

Defects in the images may include (but are not limited to):

- BLACK BORDERS
- TEXT CUT OFF AT TOP, BOTTOM OR SIDES
- FADED TEXT
- ILLEGIBLE TEXT
- SKEWED/SLANTED IMAGES
- COLORED PHOTOS
- BLACK OR VERY BLACK AND WHITE DARK PHOTOS
- GRAY SCALE DOCUMENTS

IMAGES ARE BEST AVAILABLE COPY.

As rescanning documents will not correct images, please do not report the images to the Image Problem Mailbox.

GENERAL INPORMATION:
APPLICANT: Wakefield, Thomas W.
APPLICANT: Andrews, Philip C.
APPLICANT: Stanley, James C.
TITLE OF INVENTION: LOW MOLECULAR WEIGHT HEPARIN AND
TITLE OF INVENTION: LOW MOLECULAR WEIGHT HEPARIN
ITILE OF INVENTION: ANTICOAGULATION REVERSAL
NUMBER OF SEQUENCES: 13
CORRESPONDENCE ADDRESS:
ADDRESSEE: Benita J, Rohm, Esq.
STREET: 512 Springfield avenue
CITT: Cranford
STREET: New Jersey Sequence 3, Application US/08152488 Patent No. 5534619

STATE: New Jersey
COUNTRY: United States of America
ZIP: 07016-1811
COMPUTER READABLE FORM:
MEDIOM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: MS-D6
OPERATING SYSTEM: MS-D6
OPERATING SYSTEM: MS-D6
OPERATING SYSTEM: US-08/152,486
FILING DATE: 12 NOV-1993
CLASSIFICATION NUMBER: US-08/152,486
FILING DATE: 12 NOV-1993
CLASSIFICATION NUMBER: PCT/US92/08069
FILING DATE: 14-AUG-1993
ATONNEY-AGENT INPORMATION:
NAME: ROAM, Benita J.

TELEFAX: 908-276-5533 INFORMATION FOR SEQ ID NO: 3: SEQUENCE CHARACTERISTICS: LENGTH: 29 amino acids

ORGANISM: N/A
UBLICATION INFORMATION:

TOPOLOGY: N/A MOLECULE TYPE: peptide ORIGINAL SOURCE: TYPE: amino acid STRANDEDNESS: N/

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     sequencing reads that have not been assembled into contigs. Runs of N are used to separate the reads and the order in which they appear is completely arbitrary. Low pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced. However, it should not be assumed that this clone will be sequenced to completion. In the event that the record is updated, the accession number will
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  http://ftp.genome.washington.edu/RM/RepeatMasker.html

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence represents a nucleic acid molecule which encodes a secreted human protein. The gene number, and the clone it is derived from, are detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin protein as compared to the human protein only.

To protein as compared to the human protein only.

The invention relates to 86 novel genes and their fragments (nucleic acid sequences: AAX04311-X04410; amino acid sequences AAX78126-W78225) which are useful for preventing, traating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypuciectides in a sample or by determining the presence of mutations in the new polymuclectides. Specific uses are described for each of the 86 polymuclectides, based on which tissues they are most highly expressed in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 319
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               379

Human proteins and DNA encoding sequences useful for preventing, treating or ameliorating a medical condition in a mammalian subject e.g. arthritis and cancer

Claim 1; Page 851; 1963pp; English.

Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and conserved ABB10981-ABB12330 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the novel polypeptides. Constitution days of producing the novel polypeptides of the invention. Although novel many of the undertient of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence controlled the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence controlled thereby giving an insight into their probable biological activities, and hence of interpretation activities, including cytokine, cell proliferation or cell manusmodulatory activity; tissue growth activity; mematopolesis regulatory activity; tissue growth activity; immunodulatory activity; tissue growth activity; immunodulatory activities; properties of more activities; content in their confidence of the invention are useful for perventing, treathed activities; or may be encoorgenesis, cancer cell proliferation or metastasis.

Conditions, e.g., by protein or gene therapy. Such conditions include cancers, heamatopoletic disorders (e.g., myabloid or lymphoid cell of sorders) conditions, e.g., by protein or gene therapy. Such conditions include cancers, heamatopoletic disorders (e.g., osteoporosis), and abnormal vascular growth. Polypeptides involved with tissue regeneration and repair of bacterial ischaemia, bone disorders (e.g., osteoporosis), and abnormal repair growth. Polypeptides involved with tissue regeneration and repair of propriet activities may be used to promote cell growth. Polypeptides may be used to promote cell growth. Factor activity may be used in cell cultures to promote cell growth. Factor activity may be used to promote cell growth. Factor activity may be used to promote cell growth. Factor activity may be used to supply be use

                                                                                                                                                                                                                                                                                                                                                                    The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine. cell proliferentiation or which may induce production of other cytokines in other cell populations. The polypeptides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity, inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation.

The invention relates to novel isolated human secreted polypeptides (I) and polypeptides (II) are useful for treating and polypucleotides (II). (I) and (II) are useful for treating influry, shock, sepsis, immune responses, and is involved in increasing haematopoiesis, stem cell survival, bone growth and remodeling (I), (II) and modulators of (II) are useful for prophylaxis or treatment of one or more cancers. (II) is also useful for creating transgenic animals useful for studying the in vivo activities of the polypeptide as well as for studying modulators of the polypeptides. (I) induces the proliferation of neural cells and regeneration of nerve and brain tissue and is useful for the treatment of central and peripheral nervous system diseases and neuropathies, such as Alzheimer's, Parkinson's disease, Huntington's disease, and amyotrophic lateral calling vivo disease, and amyotrophic lateral activity, regulation of haematopoiesis and is useful for treatment of contraction of the manatopoiesis and is useful for treating myaeloid or lymphoid cell disorders, platelet disorders such as thrombocytopenia con lymphoid cell disorders, platelet disorders such as thrombocytopenia cuicers, for treating osteopromis, osteoarthritis, bone degenerative disorders, or periodontal disease. Furthermore, (I) is also useful for disorders, or periodontal disease. Furthermore, (I) is also useful for disorders including severe combined immunodeficiency (SCID), betterial or funcal infertions and treatment of lung or liver fibrosis, functions immuno disorders and fibrodians and survived immunodeficiency (SCID), betterial or funcal infertions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        fungal infections, autoimmune disorders e.g. multiple sclerosis, rheumatoid arthritis, diabetes mellitus, myasthenia gravis, allergic reactions and conditions, such as asthma or other respiratory problems. In addition, (1) affects biorlythms or circadian cycles of rhythms, fertility, metabolism, catabolism, anabolism, storage or elimination of dietary fat, lipid, protein, carbohydrate, vitamins, minerals, provides analgesic effects or other pain reducing effects, immunoglobulin like activity and can act as an antigen in a vaccine composition to raise an immune response. AAS44920-AAS45295 represent novel human secreted protein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This sequence represents a nucleic acid molecule which encodes a secreted human protein. The gene number, and the clone it is derived from, are detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin protein (e.g. AAX04302) for increasing the stability of the fused protein as compared to the human protein only.

The invention relates to 86 novel genes and their fragments (nucleic acid sequences: AAX04311-X04410; amino acid sequences AAX04311-X04410; amino acid sequences AAX04325) which are useful for preventing, treating or amplicating medical conditions can be diagnosed by determining the amount of the new polypueldes in sample or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the 86 polynucleotides, based on which tissues they are most highly expressed in
                                                                                                                                                                                                                                                                                                                                                                                                                               Lafleur DW;

The present invention describes primer sets for synthesising 5602

full-length cDNAs defined in the specification. Where a primer set
compliantses: (a) an oligo-dT primer and an oligonucleotide complementary
to the complementary strand of a polynucleotide which comprises one of
the 5602 nucleotide sequences defined in the specification, where the
coligonucleotide comprises at least 15 nucleotides; or (b) a combination
of an oligonucleotide comprising a sequence complementary to the
complementary strand of a polynucleotide which comprises a 5'-end
sequence and an oligonucleotide comprising a sequence complementary to the
complementary strand of a polynucleotide which comprises a 5'-end
sequence and an oligonucleotide comprising a sequence complementary to a
polynucleotide which comprises at 3'-end sequence, where the
coligonucleotide which comprises at 15 nucleotides and the combination of
the 5'-end sequence 3'-end sequence 15 selected from those defined in
the specification. The primer sets can be used in antisense therapy and
in gene therapy. The primers are useful for synthesising polynucleotides,
particularly full-length cDNAs. The primers are also useful for the
contection and/or diagnosis of the abnormality of the proteins encoded by
the full-length cDNAs. The primers are also useful for the
cDNAs easily without any specialised methods. AAH03616 to AAH13628 and
AAH13633 represent human aniho acid sequences; AAB92446 to
AAB95893 represent human aniho acid sequences; and AAH13632
crepresent oligonucleotides, all of which are used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the

The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, immunomodulatory activity and activity, tissue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             qq
                                                                                                          The present invention describes colon tumour associated proteins (I) and the present invention describes colon tumour associated protein (I) and (II) can be used in gene therapy and vaccine production. (I) and (II) may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate colon tumour associated protein (TCAP) expression, such as colonic cancer. For example, (I) and (II) may be expression, such as colonic cancer. For example, (I) and (II) may be used to treat disorders associated with decreased expression by contractions or deletions in a patient's genome that affect the activity of TCAPs by expressing inactive proteins or to supplement the parients own production of them. Additionally, (II) may be used to complementary sequences may also be used as DNA probes in diagnostic complementary sequences may also be used as DNA probes in diagnostic complementary sequences may also be used as DNA probes in diagnostic complementary sequences may also be used as DNA probes in diagnostic quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. (I) may calso be used as antigons in the production of antibodies against TCAPs and in assays to identify modulators of TCAP expression and activity.

Anti-(I) antibodies and antagonists may also be used to down regulate to TCAP expression and activity. The anti-(I) antibodies may also be used as diagnostic agents in the presence of TCAP expression and activity.

CAP expression and activity. The anti-(I) antibodies may also be used as diagnostic agents in the presence of TCAP expression and activity.

CAP expression and activity. The anti-(I) antibodies may also be used as diagnostic agents incomplement assay (ELISA). AAIZ460 to AAIZ9512 represent nucleaded and animo acid sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ·;

The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been sisolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence was used as the representative sequence from a human clone which was used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        homology searches to identify the clone.
Note: The sequence data for this patent did not form part of the printed
specification, but was obtained in CD-ROM format directly from EPO.

                                                        Th present invention relates to the isolation of novel cDNA sequences encoding for at least an immunogenic portion of human colon tumour proteins. The sequences of the invention are useful in pharmaceutical compositions and vaccines for the prevention and treatment of cancers such as colon cancer. They are also useful for the diagnosis and monitoring of such cancers. Antibodies to the colon tumour proteins and antigen presenting cells that express polynucleotides encoding colon tumour proteins can be used to inhibit the development of cancers. Treels that react specifically with colon tumour proteins
                                                                                                                                                                                                                                                                                                                                       Human; colon tumour protein; colon cancer; gene therapy; cytostatic;

The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been clones. 830 cDNA molecules sequences of 5 - and 3 - ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a full length but any special methods. The present sequence is a full length but and contains the contains t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      human cDNA of the invention.

The present invention provides the coding sequences and some protein sequences of proteins associated with breast cancer in humans. These sequences can be used in the diagnosis and treatment of cancers,

Sequence 301 BP; 48 A; 96 C; 72 G; 85 T; 0 other;

particularly breast tumours.

```
The invention relates to isolated breast tumour proteins and nucleic acids that encode them, including immunogenic fragments of the proteins. Also included are expression vectors expressing the proteins. Least including immunogenic fragments of transformed cells and antibodies raised against the proteins or proteins, transformed cells and antibodies raised against the proteins or uncleic acids may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate breast tumour protein expression, i.e. breast tumours and breast cancer e.g by gene therapy. The nucleic acids and their complements may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. The proteins, nucleic acids and antibodies may be used in assays to identify modulators (e.g. antagonists) of breast tumour protein capteression and activity. The antibodies and antagonists may also be used to down regulate expression and activity. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used to as diagnostic agents for detecting the presence of the proteins in samples (e.g. by enzyme linked immunosorbant assay (ELISA)) and in other immuno-purification diagnostic techniques. The present sequence is a cDNA from a breast tumour formal breast tumour formal breast the present sequence is the protein and activity the acid the present sequence is the print of the present sequence is the protein and activity the acid that are accounted to the present sequence is the present accounted to the present accounted

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                               1188

Patent No. 5763589

GENERAL INFORMATION:
APPLICANT: Hillman, Jennifer L.
APPLICANT: Goli, Surya K.
TITLE OF INVENTION: NOVEL HUMAN MEMBRANE PROTEIN
NUMBER OF SEQUENCES: 7

CORRESPONDENCE ADDRESS:
ADDRESSEE: Incyte Pharmaceuticals, Inc.
STREET: 3174 Forter Drive
CITY: Palo Alto
STATE: CA.
